

FIRST CALL · FOR CLOUD SECURITY ENGINEERS & ARCHITECTS

Cloud Permissions Firewall

Least privilege. Finally automated.

Sonrai Security · First Call Deck

THE PROBLEM

Development velocity creates permission sprawl. Sprawl creates risk.

Development is fast. Identities multiply. Permissions accumulate — especially among non-human, machine, and ag that nobody is reviewing.

PROBLEM 01

Overprivileged identities expand the attack surface.

Every unused permission is a foothold. Once inside, attackers move laterally, escalate privileges, and exfiltrate data — using the access your identities never needed in the first place.

PROBLEM 02

Achieving least privilege is slow, and unfinishable.

Reviewing CloudTrail line-by-line. Authoring policies. Chasing exceptions in Jira. By the time you've cleared an account, three new ones look just like the first.

WHY NOW

The data suggests urgency.

92%

of cloud identities are
overprivileged

Source: Sonrai Security

50:1

ratio of non-human
identities

Source: CyberArk

#1

cloud attack vector in 2026 is
identity

for an agent to
database — P

Source: Industry rep

Three approaches. None of them finish the job.

01

DIY manual policy work

Reading CloudTrail logs. Authoring IAM policies identity by identity. Tracking exceptions in spreadsheets and tickets.

Why it falls short

Doesn't scale past a few hundred identities. By the time you finish, the environment has changed.

02

Visibility-only CIEM

Wiz, Orca, Tenable, AWS Access Analyzer. Dashboards, severity scores, recommendations.

Why it falls short

Generates findings, not enforcement. The backlog grows; the policies never get written or deployed.

03

Traditional PAM

CyberArk, Delinea, BeyondTrust. Session brokers built to manage privileged users.

Why it falls short

Wasn't designed for cloud. 50:1 explosion of machines.

Cloud Permissions Firewall

Sonrai's Cloud Permissions Firewall automatically enforces least privilege using real cloud activity – restricting excessive permissions, quarantining dormant identities, and blocking unused services or regions.

THE PROMISE

Without disrupting a single DevOps workflow.

From visibility to enforcement — in one workflow.

Sonrai sees what's unused → builds the policy → deploys default-deny → grants real access just-in-time

The only solution that closes the loop.

	CNAPP CIEM (Wiz, Orca, Tenable)	Cloud-Native Tools (AWS, Azure, GCP)	Traditional PAM (CyberArk, Saviynt)
Visibility into permissions	●	●	○
Automated policy generation	○	○	○
Deploys default-deny enforcement	○	○	○
Just-in-time access workflow	○	○	●
Built for NHI / agentic AI scale	●	○	○

Every other tool stops at the finding. We deploy the policy.

Wins the security org. Doesn't lose DevOps.

CLOUD SECURITY ENGINEER	CISO	DEVOPS / CLOUD OPS
<i>You — the owner</i>	<i>Your buyer</i>	<i>Your partner</i>
Stop building policies by hand.	Dramatic, measurable risk reduction.	Nothing the security org gets blocked by.
Automated policy generation. Org-wide enforcement. The quarterly cleanup ritual ends.	92% privilege risk reduction. A defensible least-privilege program. Audit-ready evidence on day one.	Active permissions state. New access flows through tickets, no waiting.

What customers see after deployment.

92%

reduction in privilege risk

Measured across customer environments after enforcement.

97%

time saved on least-privilege work

From quarterly hand-authoring to continuous automation.

100%

protection for

Default-deny applies to all conditions

**Based on Sonrai internal customer data analysis.*

REMEMBER THIS

Three things to take with you.

01

Make least privilege actually achievable.

From a manual, never-finished project to an automated, ongoing state.

02

Reduce risk without slowing DevOps.

Exceptions and JIT keep velocity intact — security stops being the bottleneck.

03

Future-proof for the NHI explosion.

Default-deny means every new identity — human, machine, or agentic AI — is born secure.

LET'S CLOSE THE LOOP IN YOUR ENVIRONMENT
